Date favour milling cutter

The M409 of Paul Horn company is tangential milling system is a kind of patent system, use lozenge but dislocation razor blade. Accurate and abrade razor blade realizes fast face quality on groove bottom and flank. the horn before radial and axial and flank pour horn to ensure stable wedge horn, realize particularly flowing milling thereby. Although this system also can offer rate of tall metal purify on the machine tool with dynamical knife tower and lesser power. Supply one case with in-house cooling fluid, tangential the applied range of milling system is wide, increased function and flexibility thereby.

Date favour place offers but dislocation razor blade, all 4 before knife face all undertook polishing is handled, accumulate the formation of bits tumour in order to offset special apply to aluminium alloy and plastic milling. The chamfer of the chamfer that break bits that combines the face, sharp grinding cutting blade can realize soft cutting and fast face quality. This special grade design is used a group of ISO N data to use. Bit can be used in all and relevant cutter hub.
