

Challenge high speed milling, the mould machines a knife such choosing a

Fall this synergism -- all along is the major challenge that die manufacturer faces. Came from the influence of the business domain such as 3C, car 2019 especially, make frequency of many die manufacturer outstanding achievement bright red light. "Downstream industry is pounded, upper reaches is made in the various and complex case such as workpiece, machine tool, material", mould person is very difficult!

Traditional pattern however, downstream industry seems to be able to be sent only look at future; Come from the treatment difficult problem with the complex respect such as workpiece, machine tool, material to be able to be solved however at instantly. Choose cutting tool correctly, can help die manufacturer develop the greatest potential of treatment machine tool adequately, improve treatment efficiency greatly. The development it may be said of mould technology and cutting tool technology is to supplement each other, the technology of the mould can stimulate manufacturer of hard alloy tool newlier improve appearance of cutting tool geometry to design ceaselessly, update its cutting tool to make a technology ceaselessly. Current, development went to have the special milling cutter that can process a variety of data already, also have the general milling cutter that suits a variety of treatment.
